9-Year-Old Dies Two Weeks After Taking COVID-19 Vaccine: VAERS

Enrico Trigoso

4-5 minutes

The most recent VAERS (Vaccine Adverse Event Reporting System) data shows that a 9-year-old died in California two weeks after getting one dose of a [Pfizer](#)-BioNTech jab.

The female child had no listed preexisting conditions and was not hospitalized.

She experienced 2-3 days of “stomach ache, sore throat and chest pain; two weeks after

receiving the vaccination,” [the database](#) states.

United States VAERS data from Dec. 14, 2020, to July 22, 2022, show that there were [12,232 adverse events](#) in 5- to 11-year-olds, including [313 “serious” cases](#) and [9 deaths](#).

In addition, the database lists [24 cases of heart inflammation](#), [47 cases of blood clotting](#) disorders, and [101 reports of seizures](#) in the same age group.

The case was first reported on by [The Defender](#).

According to [OpenVAERS](#), “VAERS is the Vaccine Adverse Event Reporting System put in place in 1990. It is a voluntary reporting system that has been estimated to account for only 1% of vaccine injuries.”

The VAERS system is designed to send safety warnings on vaccines, but its reports

are unverified and “cannot be interpreted as evidence of a causal association between a vaccine and an adverse event,” [according to its disclaimer](#).

Increase in Pediatric Adverse Reactions

Lawrence B. Palevsky, MD, a pediatrician, told The Epoch Times that he has been reading about “an increasing number of reported adverse reactions, and deaths, in the pediatric population soon after the administration of these injections.

Unfortunately, they go unreported, and are tossed aside as having nothing to do with the COVID injections.”

“Before the implementation of the COVID injection into the pediatric population, it was uncommon to witness a healthy 9-year-old,

without any medical conditions, simply die, out of the blue, for no apparent reason,” Palevsky said.

“Today, we are hearing many more stories about children of all ages simply dying, out of the blue, with no other medical conditions, other than a recent history of having received the COVID injections.

Unfortunately, in today’s culture, and in the dominant narrative, it is inconceivable and unfathomable that COVID injections which we are told were tested for safety and effectiveness by our supposedly trusted authorities, would have any adverse reactions to the point of causing children, and adults, to die.”

Palevsky thinks that the COVID vaccines should have been studied and proven not to cause harm before being mandated on people, and especially on children who, he

thinks, “makes no sense” to administer to, since they are not in serious danger from COVID.

“Sadly, this child will be buried, and no one in a position of authority will investigate whether [her] death was related to an adverse reaction to the COVID injection. And, even if there is an investigation, you won’t hear any news that [her] death was, in fact, related to an adverse reaction to the COVID injection, as has been the sad case for so many who have died, unnecessarily, before [her],” Palevsky said.

CDC Exaggerated COVID’s Threat to Children

On June 23, The director of the U.S. Centers for Disease Control and Prevention ([CDC](#)) [falsely said](#) that COVID-19 has been one of

the five top causes of death for children since the beginning of the COVID-19 pandemic.

In addition, in March, the [CDC removed tens of thousands of deaths](#) linked to COVID-19, including nearly a quarter of deaths it had listed in those under 18 years old.

The health agency quietly made the change on its [data tracker website](#) on March 15.

The Epoch Times reached out to Pfizer and the CDC for comment.
