# KRAYDEN: Leaked 'Liberal' report on vaccines blows Trudeau's narrative apart

By David Krayden  
Sep 19, 2022

Figure 5. Distribution of confirmed COVID-19 cases reported to PHAC by vaccination status as of August 21, 2022

Latest data available from the Public Health Infobase, at time of publication. Appears to show that vaccination was no guarantee against catching COVID-19, being hospitalised with it, or even dying with it. The Public Health Infobase website toolkit is a series of Internet based tools to help visualize, analyze, interpret and disseminate health indicator data for chronic disease, injury, mental health, and child/maternal health. Data is created and distributed by the federal Public Health Agency of Canada.

Health Infobase

And you wonder why so many COVID-19 vaccine stars, like Prime Minister Justin Trudeau and our health minister, up to their armpits in booster shots, continue to get the virus and go into hiding?

According to a report dated June 2022 and purportedly commissioned by a Liberal MP, the COVID vaccine posed a risk and made “little difference” in keeping people from getting the virus, or staying out of the hospital.

If this document is authentic, and it really has been available to the Liberal government for three months, it could and should lead to the downfall of the Trudeau government.

Of course, it may not be authentic: Certainly, we make no such claim. However, the report was leaked on Sunday by a prominent Twitter account with the name of the supposed Liberal MP redacted, likewise the name of the researcher. And the report (self-referentially) assures us that we are in good hands:

“The review and analysis have been conducted in collaboration with the following statistical/analytical experts: a former Chief and a Chief currently in Statistics Canada; three Senior Analysts currently in Statistics Canada; a Professor in the Department of Mathematics and Statistics in a recognized Ontario post-secondary educational institution; a Professor Emeritus and Distinguished Research Professor from the School of Mathematics and Statistics in a recognized Ontario post-secondary educational institution. In addition, several editors have reviewed this report.” *[Sic.]*

Is this for real? In the current political climate of the Liberal caucus, with many backbench MPs wondering if they have a hope in hell of being re-elected, it is entirely plausible that at least one renegade member decided to go rogue and commission this report before it was too late. Is it possible that with Trudeau’s refusal to budge on the ArriveCAN and the damage he has wrought by alienating an increasing number of people who are not prepared to become pincushions for the remainder of their days, some clear-thinking Liberal MP thought something had to be done?

Possible, yes. But, who knows?

Be that as it may, some of what's in it is none too far-fetched. I have highlighted some relevant passages.

---

“Given the statistical evidence provided in this report, the public health policy tools such as mass vaccination campaigns, mandates, passports and travel restrictions need to be re-evaluated for relevance in this phase of SARS-CoV-2. The abundance of evidence documented by Public Health Ontario (PHO,) Public Health Agency of Canada (PHAC) and top-tier scientific journals demonstrates that the *vaccines do not prevent infection or hospitalization*. The Ontario data shows that vaccination currently makes little difference in terms of hospitalization and death rates for those below age 60. Additionally, since there are *known risks of adverse events* and unknown long-term effects, these must be considered in developing vaccine policies.”

“The empirical evidence investigated in this report from PHO and PHAC *does not support continuing mass vaccination programs, mandates, passports and travel bans for all age groups*. Rather, it may be prudent to utilize a more targeted and cost-effective approach focused on vaccinating the high-risk group, while factoring in an individual’s potential risk of vaccine-related adverse events.”

As this report was allegedly shared with the Liberal caucus in June, this revelation — if substantiated — would constitute not only incompetence by the Trudeau government but in my view deliberate malice against those who continue to be hurt financially or otherwise by their refusal to take the vaccine — such as truckers who cannot transport food across the border if they are unvaccinated.

It would also prompt us to wonder just why Trudeau ministers continue to envision a future of continued vaccinations that will keep big-Pharma replete with cash, while they continue to vaccinate the world.

So yes, there's room for doubt as to whether this report really was commissioned for the Liberal Party. The problem is — valid or not — some of it confirms what we already know from the federal government's Health Infobase, shown above as published 25th August 2022: The vaccinated and the unvaccinated were getting sick and dying at the same rate. So more double, triple and booster vaccinations have not really altered the mortality rate of the pandemic. Natural immunity, arguably, has.

I've seen no comment from the Trudeau government on this report and I'm not surprised. But if you look at the amount of evidence amassed therein — the charts, the empirical data — it is resoundingly impressive. If it's a fake, it's a sophisticated one and not easily produced by some crackpot just playing a prank on Justin Trudeau. And, the report is being tweeted by credible journalists and opinion leaders.

I would encourage all of you to read it — and weep.

---
