Amazing results of new poll about COVID and vaccine deaths

Joel S. Hirschhorn

5-6 minutes

Looks like there has been massive undercounting of COVID and vaccine deaths.

[A new poll by](#)

[Rasmussen](#) has some data that validates

what many of us
already believe,
namely that the
vaccines are
dangerous, not "safe
and effective" and
need to be pulled from
the market
immediately.

The survey of 1,078

American adults was
conducted March
27-29, 2023, by
Rasmussen Reports.
The margin of
sampling error is +/- 3
percentage points
with a 95% level of
confidence.

A key finding is that

nearly as many
Americans believe
someone close to
them died from side
effects of the
COVID-19 vaccine as
died from the
disease/infection
itself.
This latest

Rasmussen Reports
national telephone
and online survey
finds that 11% of
American adults say a
member of their
household died from
COVID-19, while 86%
answer no. That
percentage equates to

roughly 25 million adults. Both the 11% and 25 million figures are incredibly high. They also equate to a very high number of households, many millions. Are all these figures consistent with what CDC says is the

total number of
COVID deaths of just
over 1 million?

TRENDING: [The real
Day of Vengeance](#)

NO!

The survey result
suggests a massive
under-counting of
COVID deaths by the

government, and that many more millions of Americans died from COVID! How can this be explained? One possible answer is that many deaths occurred at homes rather than hospitals. Another is that

ordinary people
viewed some deaths
in their household
were incorrectly
attributed to various
ordinary health
problems (such as
cardiac deaths) but
were actually caused
by COVID infection.

Ten percent say a member of their household died whose death they think may have been caused by side effects of COVID-19 vaccines, while 85% say there were no such deaths in their household.

This figure is
shockingly
inconsistent with the
approved narrative,
actually propaganda,
of "safe and effective"
that has been so
actively spread by
corporate media, the
U.S. government and

the entire public health and health care establishments. Here too this survey result indicates a massive under-counting of vaccine deaths if some 25 million Americans have this view. Various studies

indicate a total of
some 500,000
vaccine deaths.

These findings come
at a time when overall
concern about
COVID-19 is clearly
on the decline. Forty-
eight percent of
Americans are less

concerned about
COVID-19 than they
were a year ago,
compared to 20% who
say they're more
concerned. Thirty-one
percent say their
concern about
COVID-19 has not
changed much in the

past year.

More Democrats

(16%) than

Republicans (12%) or

those not affiliated

with either major party

(6%) say a member of

their household died

from COVID-19. More

Republicans (15%)

than Democrats
(13%) or the
unaffiliated (5%) say a
member of their
household has died
whose death they
think may have been
caused by side effects
of COVID-19
vaccines.

The section above is key, because the difference between Democrats and Republicans is almost the same concerning either deaths from COVID or COVID vaccines. If there had been statistical

significance between
these two groups,
Rasmussen would
have indicated that.
Please keep in mind
that it is now widely
accepted by those
who follow the data
that the COVID
vaccines available in

the United States *do not prevent* infection, replication, or spread of SARS-CoV-2, and *do not prevent* either hospitalized disease or death from COVID-19. Given these facts, references to these

biologic medical
products as
"vaccines" is merely
propaganda. They
clearly do not
"vaccinate" in the
classic sense. But
they make billions of
dollars for vaccine
makers.

Other details about
the poll:

Married adults and
those with children at
home are more likely
than their single or
childless peers to say
a household member
has died either due to
COVID-19 or to side

effects of the
COVID-19 vaccine.
Americans with
annual incomes over
\$100,000 are more
likely to say they're
more concerned
about COVID-19 than
they were a year ago,
compared to those

with lower incomes.

Higher-income

Americans are also

more likely to say a

member of their

household died from

COVID-19.

Remarkably, among

those who say a

member of their

household died from
COVID-19, 54% also
say a member of their
household has died
whose death they
think may have been
caused by side effects
of COVID-19
vaccines.

More than three years

after "15 days to slow
the spread" of
COVID-19, most
voters have less trust
in government health
experts – and in the
news media, too.

What a horror story.
