Pfizer Invests Billions in Treatments for Coming 'Heart Failure Pandemic' - Slay News

Frank Bergman

3–4 minutes

Pfizer is investing billions of dollars in treatments to prepare for a looming “heart failure pandemic.”

The Covid mRNA vaccine maker is making a big investment in treatment for heart failure as cases of myocarditis and sudden cardiac deaths skyrocket.

The pharmaceutical giant recently acquired several companies.

This includes a major \$6.7 billion cash acquisition of Arena Pharmaceuticals.

Arena Pharmaceuticals is a firm specializing in developing treatments, particularly for heart inflammation conditions like myocarditis and pericarditis.

Pfizer is now predicted to make tens of billions of dollars in profits from the spike in heart failure.

The company is expecting to capitalize on the huge spike in heart failure as sales of its Covid vaccines have now dried up.

The news comes as scientists are now warning that the latest Covid variant could trigger a “heart failure pandemic.”

Research into the new strain known as JN.1, could cause a “global healthcare risk” related to COVID-19.

Scientists claim this strain of the virus could start a “heart failure pandemic.”

Health experts have warned that there is an increase in the chances of potential heart issues for those who catch the disease.

Due to the influx of a new strain JN.1, there has been a spike in Covid cases in several countries.

Scientists are claiming that new strains are responsible for the spike in deadly heart failure that started in 2021.

WATCH:

Countries including the US, UK, China, and India have all suffered soaring heart failure cases in recent weeks.

Japan’s top research institute Riken has now issued a warning in the new report.

The report states that the ACE2 receptors, which the coronavirus clings to within human cells, are “very common” in the heart.

This means many people who catch the virus may suffer from “reduced cardiac function,” the scientists claim.

Health officials are warning that combined with a rising number of flu cases, this winter may see a significant increase in illness cases.

The [report](#) states:

“Even though conclusive clinical evidence that persistent SARS-CoV-2 infection is associated with declined cardiac function has not been reported so far, the proof-of-concept study of the possibility of SARS-CoV-2 persistent infection of the heart and the potential risk of opportunistic progression of heart failure should be validated by a three-dimensional human cardiac tissue model which would serve as the alarm bell for a global healthcare risk.”

The report fails to note, however, that the spike in heart failure is almost exclusively among the Covid mRNA vaccinated.
